PTFE Molded V-Ring Packing Sets

225 Series

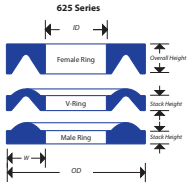

Originally used as replacements for AN-6225 packings in rubber or leather, this low-profile design has become the industry standard for PTFE packing sets.

625 Series

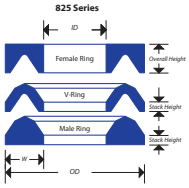

This higher-profile design minimizes the number of rings needed to fill a stuffing box. The rounded top of each ring forces the lips of the adjacent rings to flare radially, creating the desired seal. The large void areas permit thermal expansion where binding may be an issue.

825 Series

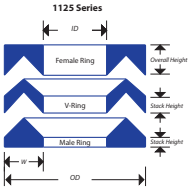

For lower operating pressure the thinner "legs" of this higher-profile design allows for sealing with less compression of the packing set.

1125 Series

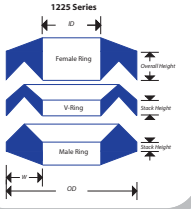

The heavier walls and cross section of this design will withstand higher operating pressures. When used in conjunction with a notched wiper-ring, this series is used as Control Valve stem packing set.

1225 Series

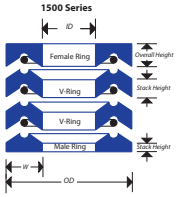

The 1225 series represents the beveled adapter variant of the 1125 series, This beveled adapter configuration retains the same profile as its predecessor, but with enhanced structural integrity by its increased wall thickness and cross-sectional area.

1500 Series

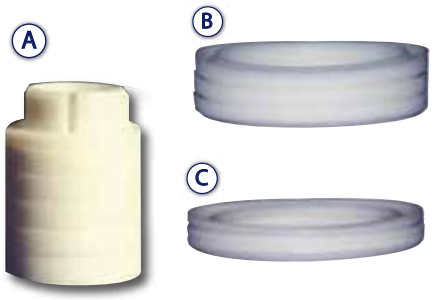

This design incorporates an internal rubber "O"-ring as an energizer, which helps compensate for the cold-flow in PTFE under pressure. When compressed the rubber ring is completely encapsulated and thereby insulated by the PTFE from exposure to undesired substances.

HAVE A CUSTOM SIZE OR CONFIGURATION?

please contact us directly for a quotation.

- Custom Stack Height
- ID down to 1/8"
- OD up to 4"
- Prime Grade PTFE
  100% Virgin and Filled Resins

Shown Above: A) F/4V/M/wiper B) V-Rings Thicker Height C) V-Rings Thinner Height
